These two connections are essential to better understand the foundations: Python Programming - SetupDigital Environment Logic Gates (Part 1) The Booleans are true or false. The Train Operators defined in the booleans are: 1, No 2, and 3, or these wide operators are also listed in their operating order. In addition, the first figure at this stage shows the rules of Boolean is. As seen in the second figure, I used the Python interpreter to make some examples to understand the functions of each operator of the otogopy. Examples> not true false> false and true false> true or false true >> True and no false Trueit is also important to know that python has a boolean interpretation for non-boolean values for values . For example, any value is not zero is interpreted as True and Zero is interpreted as false. In addition, the following comparison operators are supported in Python: 1. == (equal) 2. != (not equal) 3. > (strictly superior a) 4. = (greater or equal) 6.
